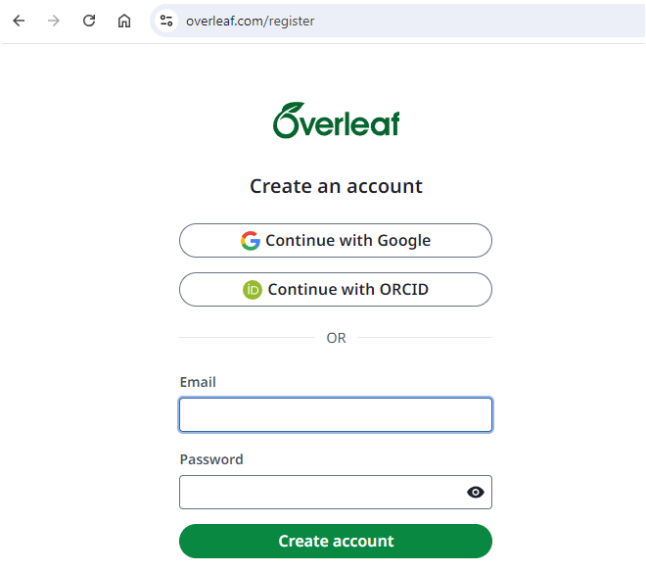
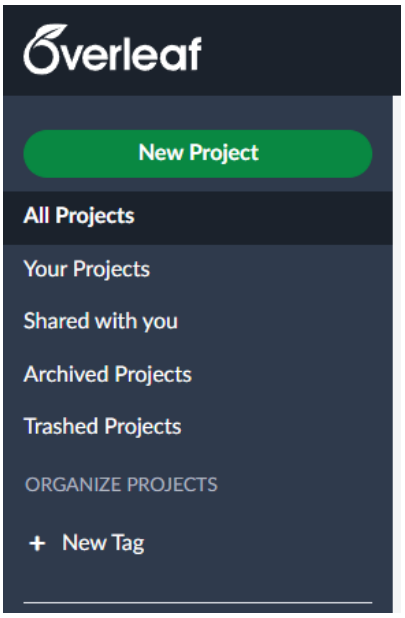
Instructions for CS4010/6010 Assignment 1 - Using Overleaf online LaTeX editor to create and share document

In the first assignment for CS4010/6010, you will learn how to create and share a LaTeX document, which is a widely used format in academia for scientific publications. While there are many free and paid LaTeX editors with different features and levels of user-friendliness, you will use the Overleaf online LaTeX editor (https://www.overleaf.com/) for the writing assignments in this class. Overleaf offers both free and paid memberships. With its free account, the number of collaborators you can invite as co-authors is limited to one for each of your LaTeX projects. Because you will be the sole author for all the class assignments, this limitation should not be an issue. In order to help you familiarize the LaTeX editing workflow, step-by-step instructions are provided below to show you how to create a LaTeX project from IEEE conference paper template on Overleaf and what to submit on Canvas.

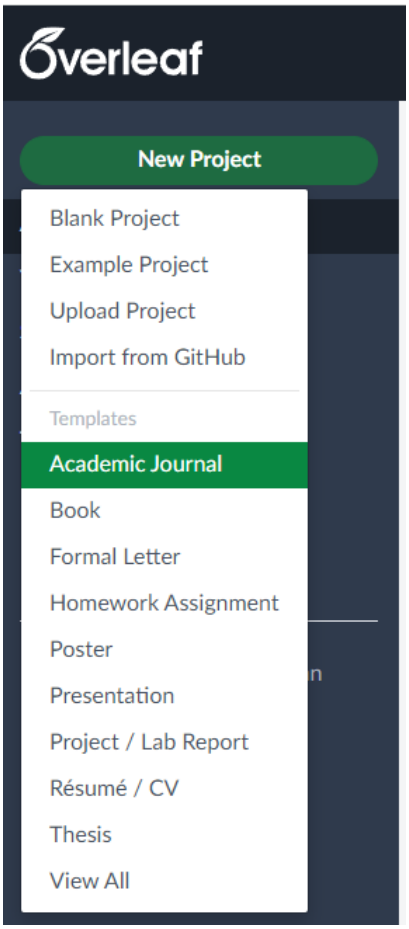
1) You will start with creating a free account on Overleaf (https://www.overleaf.com/register). Since you will use Canvas to submit a shared link to your LaTeX project and a compiled document in the form of PDF, your TA will be able to keep track of its author even if you do not use university email for Overleaf account. Therefore, feel free to use any email you prefer to create an Overleaf account (Figure 1).



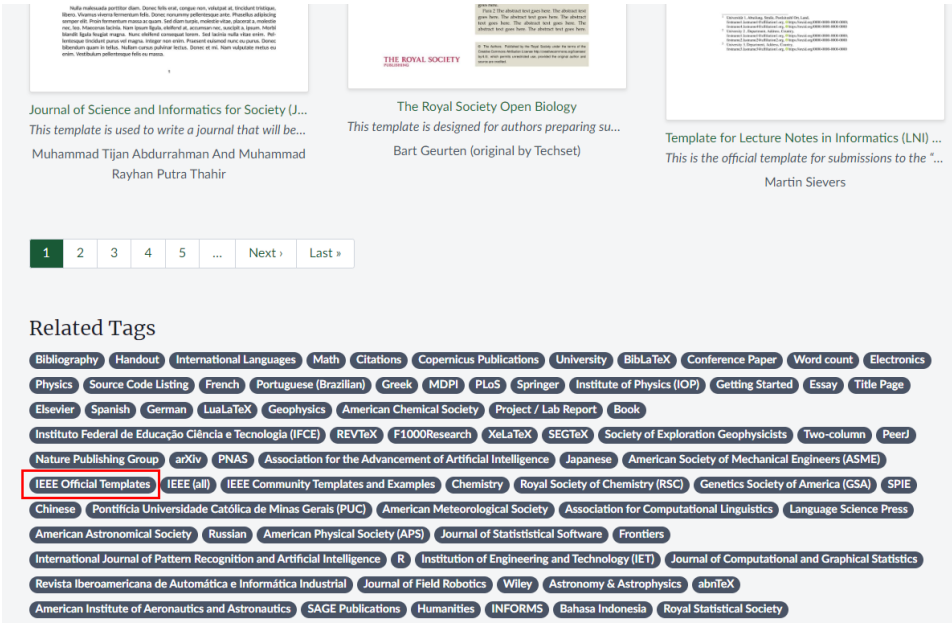
2) After you log into Overleaf, all LaTeX projects that you created or joined as co-author should be listed under “All Projects”. If this is your first-time log-in, this list will be empty. Click the “New Project” button on the left to create a new LaTeX project (Figure 2).



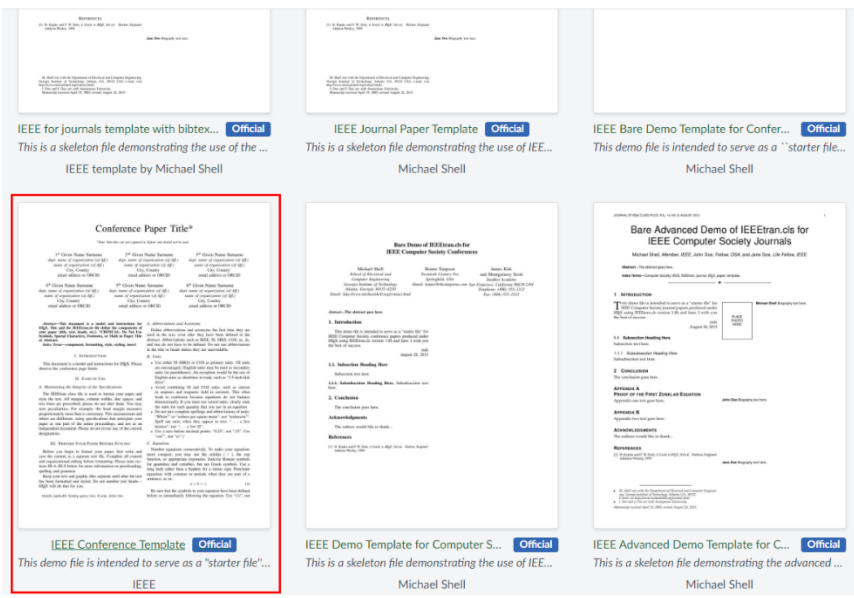
Select “Academic Journal” in the templates drop-down menu (Figure 3).



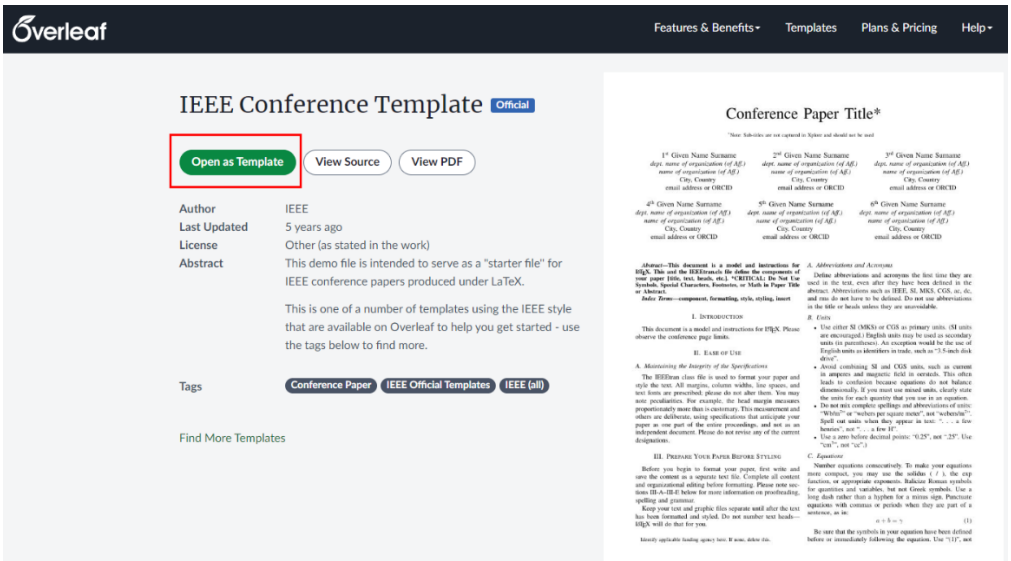
3) On the “Gallery - Academic Journal” page, scroll down to “Related Tags” section at the bottom and click on “IEEE Official Templates” (Figure 4). This should take you to the “Gallery - IEEE Official Templates” page.



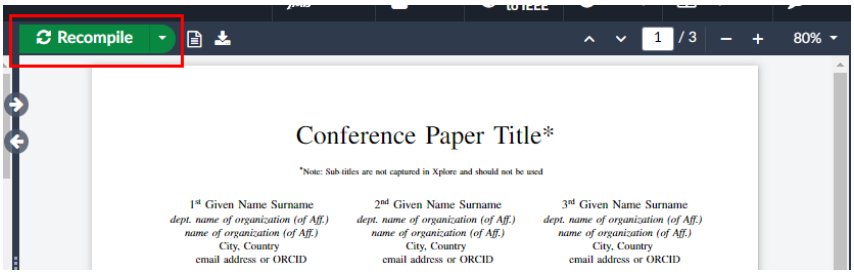
4) Choose “IEEE Conference Template” in the template gallery (Figure 5) to open its preview page.



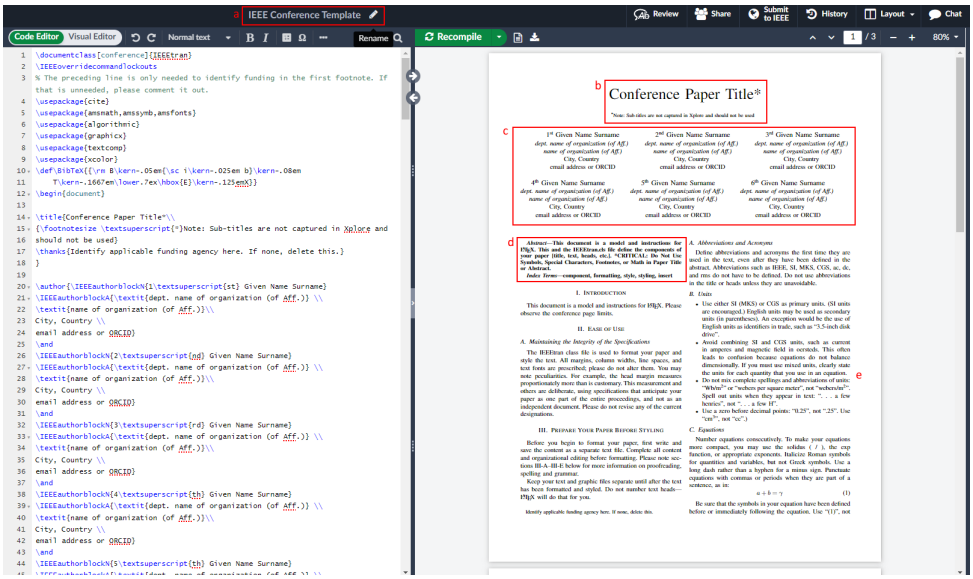
Next, use “Open as Template” button to create a new LaTeX project from this template (Figure 6).



5) By default, Overleaf opens the newly created project in a two-pane view. The editor pane on the left shows the source codes of an opened LaTeX project. The PDF pane on the right shows the rendering of compiled LaTeX project as a PDF document. Whenever changes are made in the editor pane, you can use "Recompile" button to refresh the rendering of LaTeX project (Figure 7).



6) Make the following changes to your LaTeX project (Figure 8):



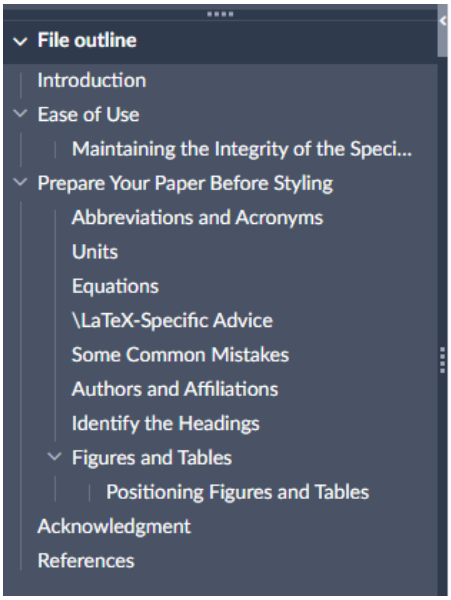
a) LaTeX project name: Change it from “IEEE Conference Template” to something more meaningful.

b) Conference paper title (line 14): Give your paper a title. You should also delete the sub-title (line 15-16).

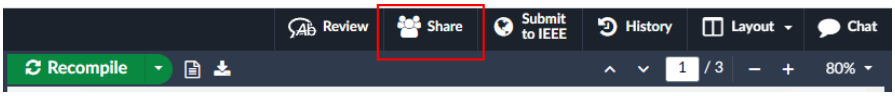
c) Author name and contact information: Edit your information as the first author (line 20-24). Delete name and contact information for co-authors (line 25-54) and information on funding agency (line 17) since they do not apply to your assignment.

d) Abstract (line 60-62) and index terms (line 66): You should edit this section to match the content of your writing.

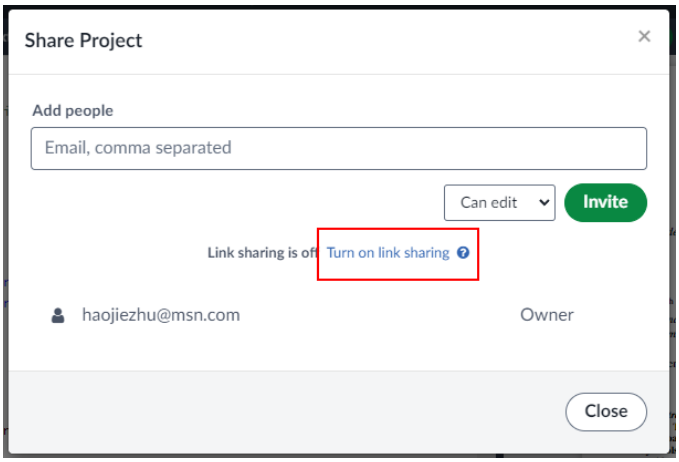
e) Main texts (line 69-245): Your writing can be organized by the hierarchy of section (“\section”), sub-section (“\subsection”), and paragraph (“\paragraph”). You can use the “File outline” pane on the left to navigate within this hierarchy (Figure 9).



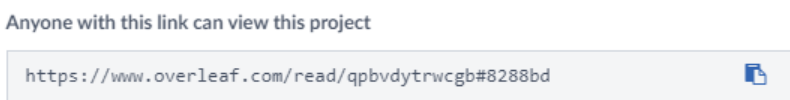
6) When you are done with editing, create a shared link to your LaTeX project with the “Share” button on the top (Figure 10).



On the “Share Project” pop-up window, click “Turn on link sharing” (Figure 11).



Copy the link under “Anyone with this link can view this project” (Figure 12). This is the link you should submit on Canvas. Since your TA only needs to view your project, do not submit the link under “Anyone with this link can edit this project”.



(7) Add the last section in your latex file as follows

\section*{Overleaf Link to Share the Report}

\href{”Copy the shared link above here”}{a link for the project at Overleaf}

Then you will see the compiled pdf file as follows

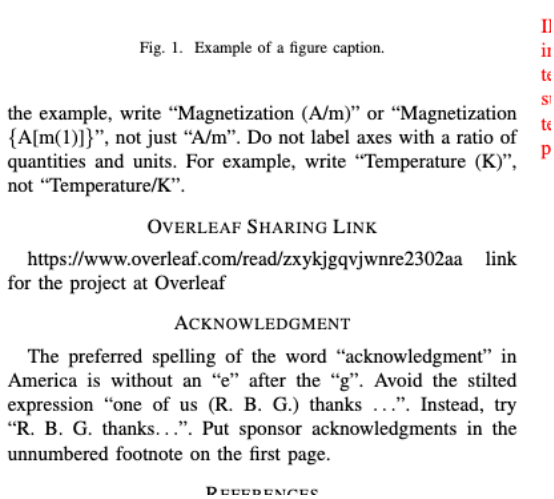


Fig. 1. Example of a figure caption.

the example, write “Magnetization (A/m)” or “Magnetization {A[m(1)]}”, not just “A/m”. Do not label axes with a ratio of quantities and units. For example, write “Temperature (K)”, not “Temperature/K”.

OVERLEAF SHARING LINK

https://www.overleaf.com/read/zxykjgqvjwnre2302aa link for the project at Overleaf

ACKNOWLEDGMENT

The preferred spelling of the word “acknowledgment” in America is without an “e” after the “g”. Avoid the stilted expression “one of us (R. B. G.) thanks . . .”. Instead, try “R. B. G. thanks. . .”. Put sponsor acknowledgments in the unnumbered footnote on the first page.

8) Finally, download a PDF version of your LaTeX project by clicking “Recompile” first and then the “Download PDF” button after recompilation process completes (Figure 13). You also need to submit this PDF on Canvas.
